Problem–Solution Fit Template

Introduction

Problem–Solution Fit means identifying the actual problems faced by customers and developing a solution that effectively addresses those problems. In the Automated Network Request Management in ServiceNow project, the main focus is to understand the difficulties faced by employees, IT support members, and network administrators while submitting, processing, approving, and tracking network-related requests.

The proposed solution uses ServiceNow Service Catalog forms, structured request records, dynamic form fields, mandatory field validation, and automated workflows to simplify network request management. It aims to reduce manual effort, improve request accuracy, support faster assignment and approvals, and provide better visibility into request status.

Purpose

- Solve Customer Problems: Address difficulties in submitting, categorizing, assigning, approving, and tracking network requests.
- Improve Request Processing: Use ServiceNow workflows to reduce manual activities and improve the efficiency of network request handling.
- Enhance User Experience: Provide a simple Service Catalog interface where users can submit network requests with the required information.
- Improve Communication and Transparency: Provide request status visibility and notifications to help users understand the progress of their requests.
- Ensure Data Accuracy: Use mandatory fields and dynamic forms to collect complete and relevant information based on the selected request type.
- Support Better Decision-Making: Use list views and reports to help network administrators and approvers monitor requests and identify processing delays.
- Understand and Improve the Existing Process: Identify limitations in the current network request process and provide a structured, automated solution that better meets the needs of employees and IT support teams.

Expected Outcome

The proposed solution is expected to streamline the network request lifecycle, improve request tracking and approval management, reduce manual errors, and increase customer satisfaction through a more organized and transparent process.
