Project Design Phase
Proposed Solution Template

Date	4 October 2026
Team ID	
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Proposed Solution Template:

In today's IT environment, network services play an important role in ensuring smooth communication and secure access to organizational resources. Employees frequently submit network-related requests, such as VPN access, firewall changes, IP allocation, and network connectivity. Managing these requests manually can lead to processing delays, assignment errors, approval delays, and difficulties in tracking request status.

The Automated Network Request Management in ServiceNow project aims to simplify and streamline the complete network request management process using the ServiceNow platform. It uses Service Catalog forms to collect request details, mandatory field validation to improve data accuracy, and automated workflows to support request assignment and approval processes. Dynamic forms display relevant fields based on the selected request type, while list views and status tracking help administrators monitor requests efficiently.

This solution is designed to reduce manual effort, improve request processing efficiency, maintain better visibility throughout the request lifecycle, and enhance the overall experience for employees and IT support teams**.**

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Network requests such as VPN access, firewall changes, IP allocation, and network connectivity can be difficult to manage when request details, approvals, assignments, and status tracking are handled manually. This can lead to incomplete information, processing delays, incorrect assignments, and limited visibility for employees, approvers, and network support teams.
2.	Idea / Solution description	The proposed solution uses ServiceNow to automate network request management through catalog-driven forms and a structured data model. Standard ServiceNow tables are combined with a custom Network Request table to store request type, access level, business justification, and related network configuration items. Dynamic forms display relevant fields based on the selected request type, while mandatory field validation improves data accuracy. Workflow automation supports request assignment, approval processing, status tracking, and reporting.

3.	Novelty / Uniqueness	The solution combines configurable request forms, dynamic field behaviour, mandatory validation, and a structured custom Network Request table within the ServiceNow platform. It provides a centralized way to manage request information and enables approvers and network teams to monitor requests, tasks, and statuses through list views.
4.	Social Impact / Customer Satisfaction	The solution aims to improve the experience of employees and IT support teams by simplifying network request submission and improving request visibility. Users can provide the required information through structured forms, while support teams can manage requests more consistently. This can reduce repetitive manual effort, improve transparency, and support timely request processing.
5.	Business Model (Revenue Model)	The solution is intended for internal IT service management within an organization. It can provide business value by reducing administrative effort, improving operational efficiency, and supporting better use of IT resources. Implementation and operating costs depend on the organization's ServiceNow subscription, licensing, configuration, and maintenance requirements

6.	Scalability of the Solution	The solution can be extended by adding new network request categories, form fields, approval rules, assignment conditions, and reporting requirements. The combination of standard ServiceNow tables, a custom Network Request table, and configurable workflows provides a structured foundation for future enhancements as organizational requirements grow.
